## SwiftUI for the user interface

### Native file selection and Drag & Drop for easy image import

Batch image conversion  
workflows

Export size reduction  
through format and resize  
settings

Optional metadata removal  
for privacy-focused exports

---

## PIXCONVERT FOR MAC

---

### Technical Foundation of PixConvert for Mac

PixConvert for Mac is a fully native macOS app built in Swift and SwiftUI for fast, private, and reliable image processing on Apple computers. The app is designed to convert image files, reduce storage usage, and remove metadata without unnecessary complexity.

PixConvert for Mac supports batch-based image conversion and export workflows, allowing users to process multiple files in one pass. Users can convert between common image formats, apply predefined size reductions or custom pixel dimensions, and generate smaller output files when needed.

Built with Apple-native technologies, PixConvert for Mac is lightweight, maintainable, and optimized for a streamlined desktop experience.
